

Know what is worth pursuing before you commit.

AI pressure is rising faster than decision clarity. Leadership teams are being asked to show credible progress while use cases, ownership, controls and full economics may still be unclear.

The opportunity can be significant. So can the cost, complexity and operational exposure.

The scan shows where the value is real, what must be controlled and what leadership should not commit to yet.

BEFORE YOU COMMIT

- Leadership is expected to show credible AI progress while protecting value, control and execution discipline.
- Potential use cases and vendor discussions are advancing, but the business case, ownership model, access boundaries and full operating cost often remain unclear.
- A decision is needed on what is worth pursuing, what must be resolved first, and where the organisation should not commit yet.

WHAT THE SCAN CLARIFIES

- Where Agentic AI can create measurable value, and where simpler automation is the better answer.
- Whether process, data, ownership and access are ready enough.
- What controls and full operating costs must be addressed before commitment.
- Which opportunities should move to proof, preparation, hold or stop.

DECISION OUTPUTS

Decision economics

Value, full operating cost, implementation burden and proof complexity.

Critical blockers

The few issues that must be resolved before further investment is justified.

Readiness position

Whether process, data, decision and control conditions are ready enough.

First proof path

A bounded test with clear entry conditions, success measures and stop criteria.

A DEFINED ENGAGEMENT

Scope

One defined decision or use case

Duration

10 business days from kickoff to readout

Client Effort

5–6 interviews + evidence
6–9 hours total client time

Investment

CHF 15'000
fixed fee

INDEPENDENT BY DESIGN

Technology and vendor independent.
No software sales, implementation revenue or referral fees. AI is assessed against automation and process redesign. Stop is a valid outcome.

AFTER THE DECISION

If proceeding makes sense, I can support proof design, governance and independent partner selection.
Implementation is separately scoped.

First decide what deserves to be built. Then who should build it.
